

Adoption of Pavement Classification Rating (PCR)

**SWIFT CONFERENCE 2025
SEPTEMBER 25, 2025**

Peter-Paul Dzwilewski, P.E.

Objectives

- Cover background information on ACR–PCR system
- Review Canadian DND examples where PCR results vary from past PCN results
- Demonstrate new PCR feature in DND–Directorate of Architecture and Engineering Services (DAES) pavement online portal

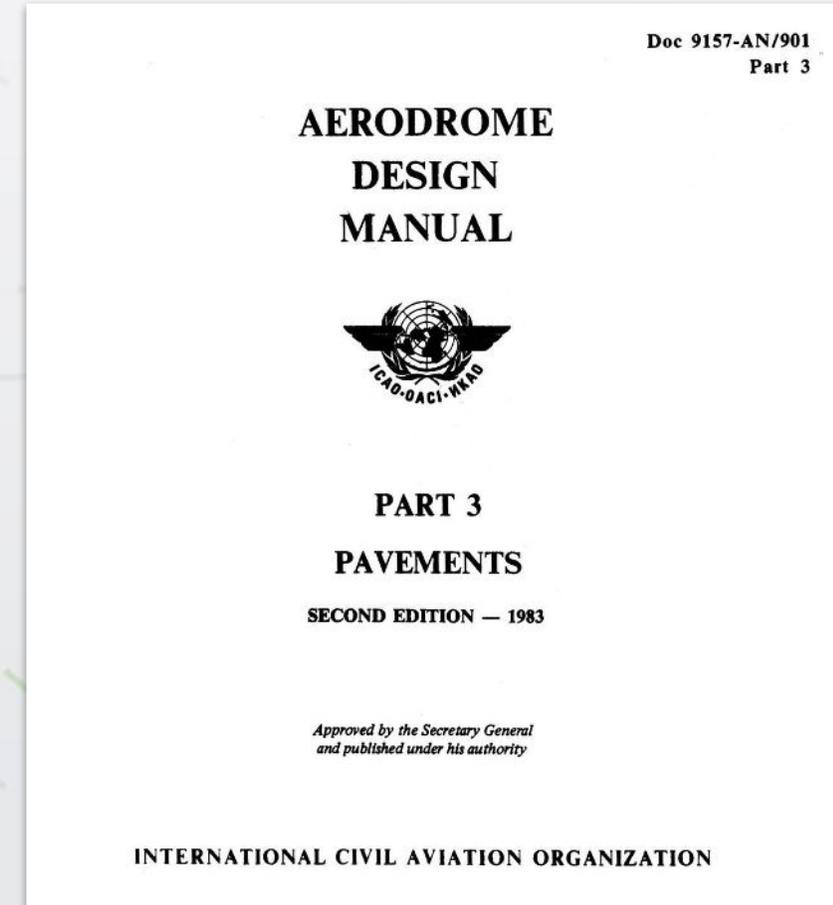

ACR-PCR Concept

- A pavement with a determined PCR value can support an aircraft that has an ACR value equal to or less than the pavement's PCR ($ACR \leq PCR$)
- Determines:
 - If a pavement can support current or projected traffic
 - If a specific aircraft can land at your airfield
 - ◆ Will limiting the aircraft weight allow for unrestricted operations?
- Aircraft with frequent operations on pavements with ACRs greater than the PCR can cause more damage than accounted for in the design and will reduce the expected life of the pavement

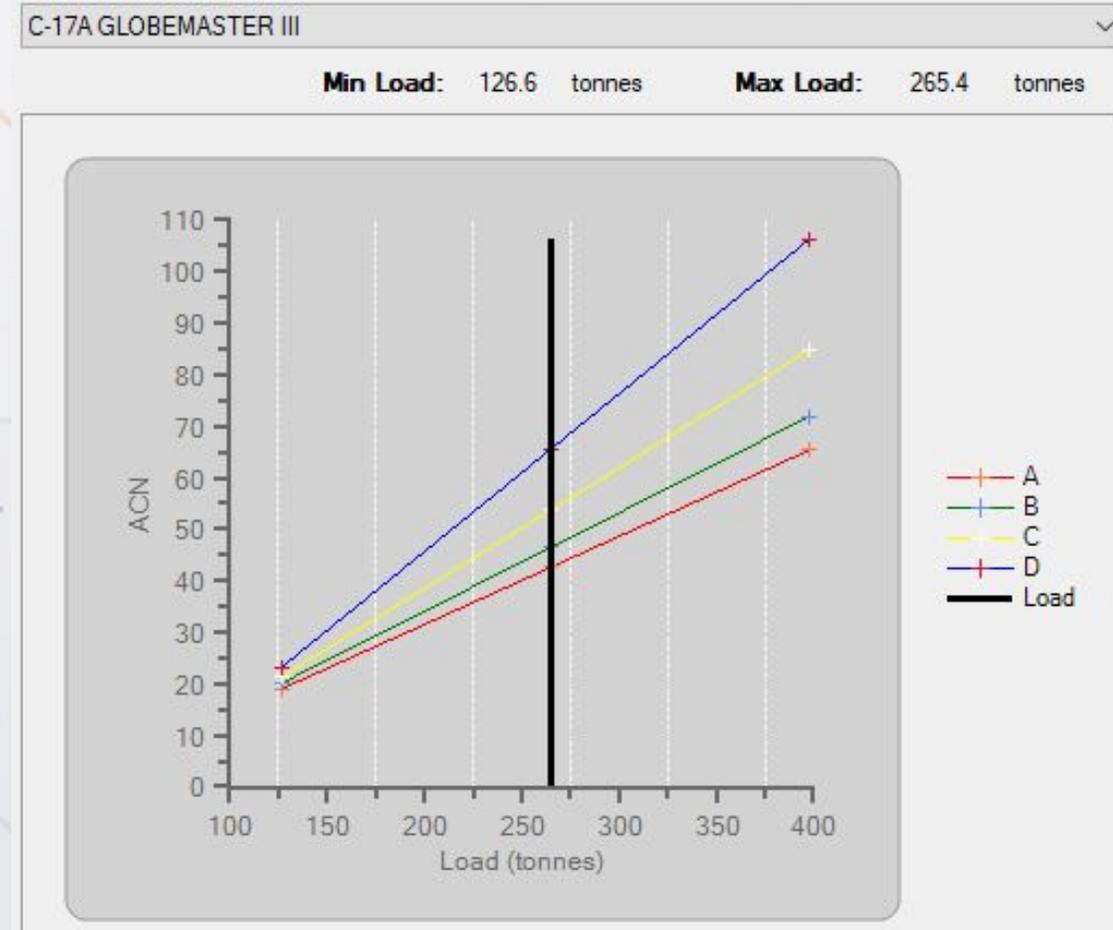

History

- ICAO was founded in 1944 and promotes safe civil aviation around the world
- Prior to 1981, many strength reporting methods were adopted by various international agencies
- ICAO implemented the PCN system to quantify Airfield Pavement Structural Capacity in 1981
- ICAO developed and implemented the PCR in 2020 to modernize structural condition reporting
- In 2024, Transport Canada incorporated ACR–PCR as the standard method of reporting airport pavement strength

PCN Overview

- ACNs are used to classify an aircraft's effect on pavement
- PCNs classify pavement load-carrying capacity using data for **only** critical aircraft's ACN
- ACN and PCN can be used to determine the Structural Index (ACN/PCN ratio) of a pavement

PCN Classification

Pavement Type

R = rigid, concrete

F = flexible, asphalt

Evaluation Method

T = technical

U = type of using aircraft

56 / R / B / W / T

Subgrade Strength

A = high, ≥ 13 CBR, ≥ 120 MN/m³

B = med, > 8 CBR, > 60 MN/m³

C = low, > 4 CBR, > 25 MN/m³

D = ultra low, ≤ 4 CBR, ≤ 25 MN/m³

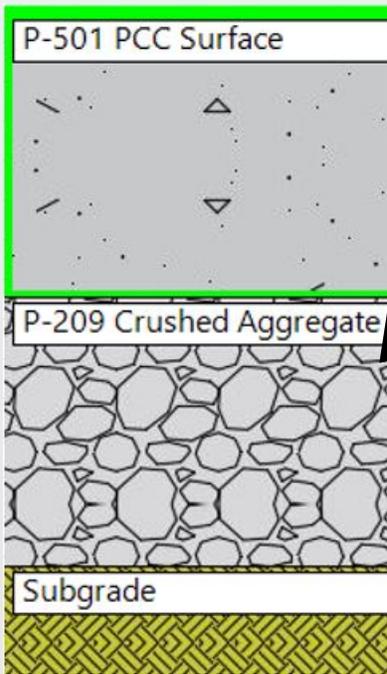

Tire Pressure

W = high, no limit

X = med, ≤ 1.75 MPa

Y = low, ≤ 1.25 MPa

Z = very low, ≤ 0.5 MPa

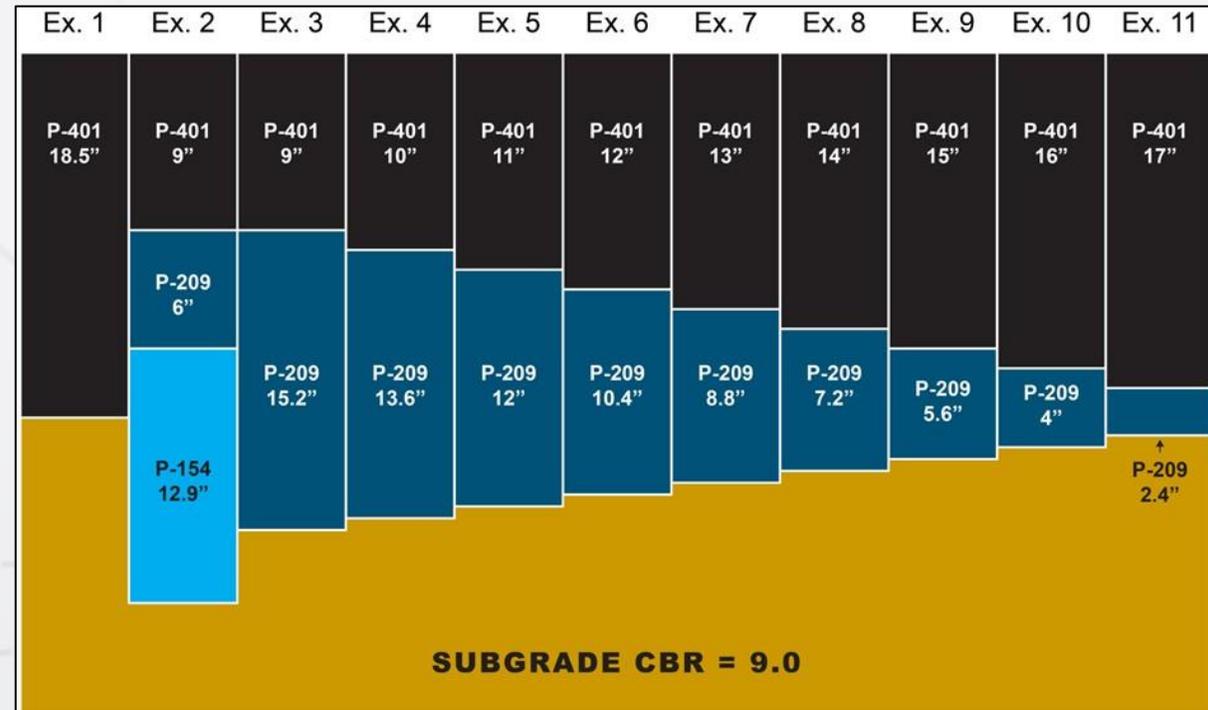

“Subgrade” strength for rigid pavements measured at the top-of-base

Issues with PCN

- 11 flexible pavements were analyzed, with varying asphalt and base thicknesses
 - All analyzed structures were structurally equivalent
- Despite differences, all had the same calculated PCN
- New classification system needed to address this issue

Aircraft	Weight, kg	Gear Type	Tire Pressure, MPa	Departures
A319-100	68,400	D	1.25	3,500
A320-200	78,403	D	1.38	10,000
A321-200	93,905	D	1.50	2,000
B737-700	70,307	D	1.36	15,000
B737-900	85,366	D	1.52	30,000
Gulfstream G-V	41,232	D	1.30	10,000
MD-11	287,124	2D/D1	1.42	5,000

PCN: 76/F/B/X/T

Use of ACR-PCR System

- Determine if:
 - Pavement can support current or projected aircraft fleet mix
 - A certain aircraft can land at your airport (i.e., once, regularly, unlimited)
 - An aircraft can operate at a restricted weight for unlimited or restricted operations
- Assess the amount of damage an aircraft will impart on a pavement
 - Every aircraft “damages” pavement – Cumulative Damage Factor (CDF)
 - Method to assess if damage on pavement is more than design indicated
 - Aircraft operating at ACR over PCR will reduce the life of the pavement
 - Rarely will an aircraft overload lead to a catastrophic structural failure

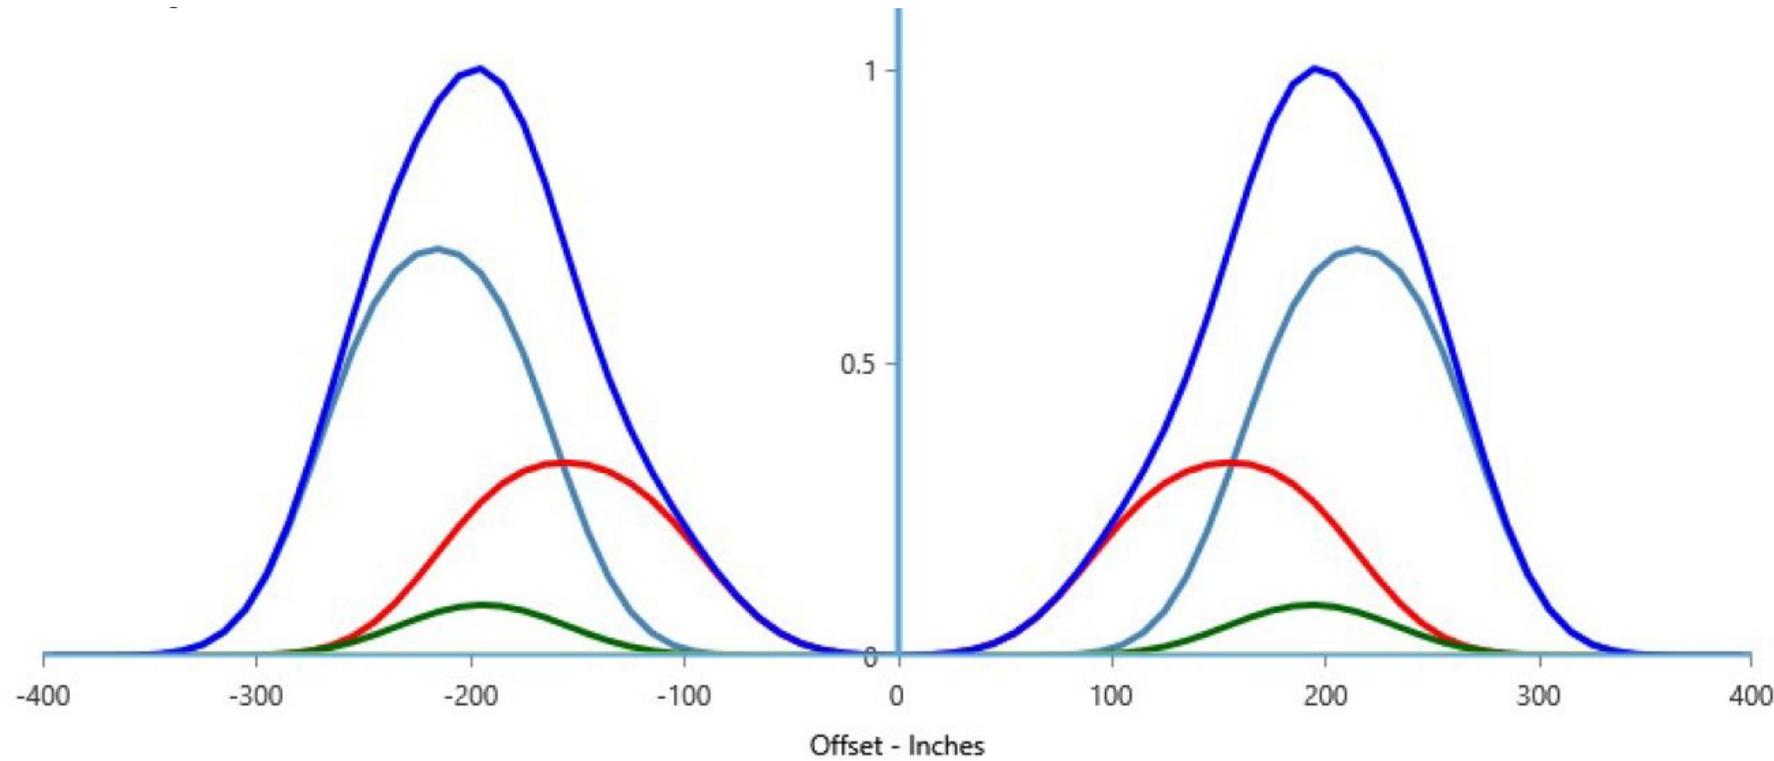

PCR Overview

- PCR system developed to improve on the PCN system
- Based on mechanistic-empirical methods
- Pavement design approach through cumulative aircraft traffic patterns using Linear Elastic Analysis (LEA)
 - LEA assumes the pavement can be analyzed as homogenous, elastic, isotropic layers stacked together
 - LEA allows individual wheel loads to be combined to obtain a combined response for aircraft gear loads
 - Entire traffic mix is accounted for instead of only critical aircraft

CDF Example

- CDF is influenced by all aircraft in mix and is dependent on gear

- Cumulative CDF
- A330-200F WV000
- C-17A
- A310-300
- F/A-18C

PCR Classification

Pavement Type

R = rigid, concrete

F = flexible, asphalt

Evaluation Method

T = technical

U = type of using aircraft

PCR (ACR)

(485 / R / B) / W / T

ACR Components

Subgrade Strength

A = high, ≥ 150 MPa (E)

B = med, > 100 MPa (E)

C = low, > 60 MPa (E)

D = ultra low, ≤ 60 MPa (E)

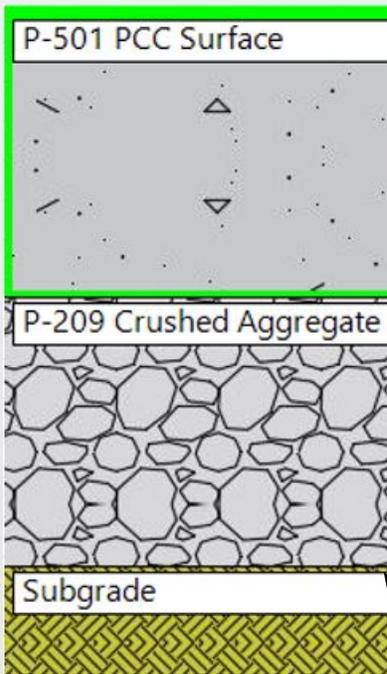

Tire Pressure

W = high, no limit

X = med, ≤ 1.75 MPa

Y = low, ≤ 1.25 MPa

Z = very low, ≤ 0.5 MPa

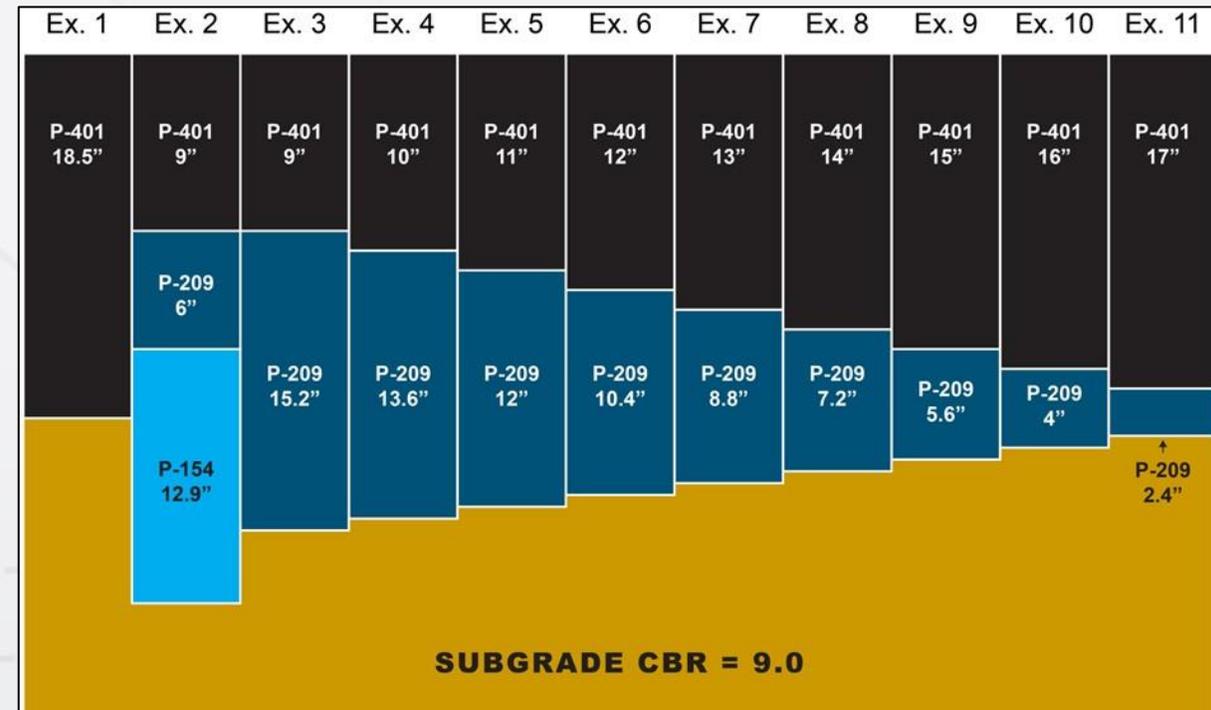

Subgrade strength for all pavements measured at the subgrade

Benefits of PCR

- Seven of the same 11 flexible pavements were analyzed
- With updated classification system, six of the sections would be overloaded with the MD-11
 - ACR = 697
- PCR system can better classify pavements by their structural capacity

Thicknesses, cm			PCN	PCR
Surface	Agg. Base	Agg. Subbase		
47.0	-	-	76/F/B/X/T	775/F/C/X/ T
22.9	15.2	32.8	76/F/B/X/T	625/F/C/X/ T
22.9	38.6	-	76/F/B/X/T	526/F/C/X/ T
27.9	30.5	-	76/F/B/X/T	549/F/C/X/ T
				581/F/C/X/ T

Example of PCR Adoption for Canadian DND Airfields

Cold Lake PCR Implementation

- ACR/PCR evaluation conducted by Englobe to update classifications from PCN to PCR system
- The ACR/PCR ratio can be referred to as the SI:

$$\frac{\text{Aircraft Classification Rating}}{\text{Pavement Classification Rating}} = \text{Structural Index}$$

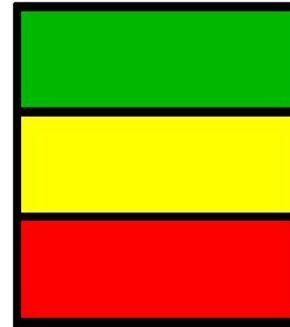

Cold Lake PCR Implementation Caveats

- DND currently uses a modified Structural Index (SI) metric with maximum take-off weights considered for network level analysis

- Maximum take-off weights uncommon during daily operations
- DAES is evaluating sensitivity of adjust SI metric

- ACRs exceeding 10% of the reported PCR and overload situation requests are sent to DAES

- DAES has published a higher PCR than the calculated value when:
 - PCR analysis showed a weaker pavement than past ACN/PCN analysis
 - **AND** no structural distress

GOOD: ACR/PCR <1.25

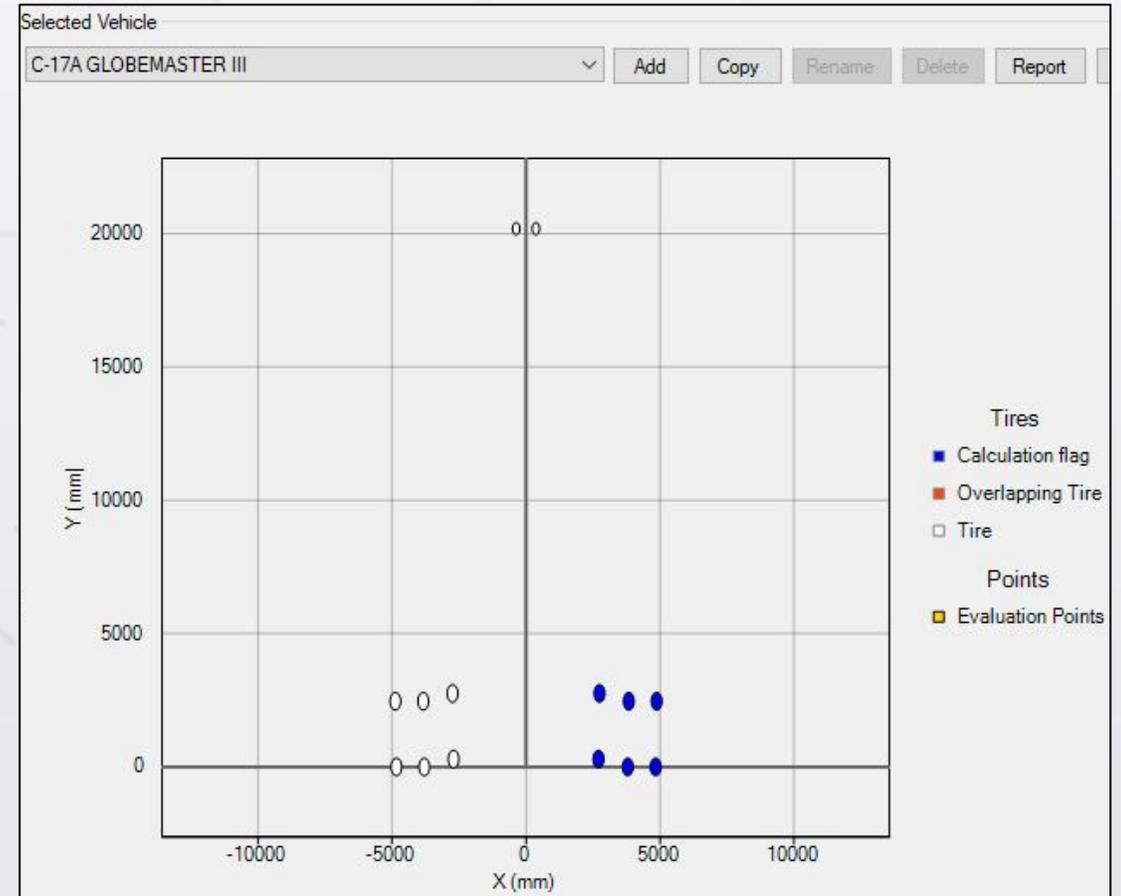

FAIR: $1.25 \leq \text{ACR/PCR} \leq 1.50$

POOR: ACR/PCR >1.50

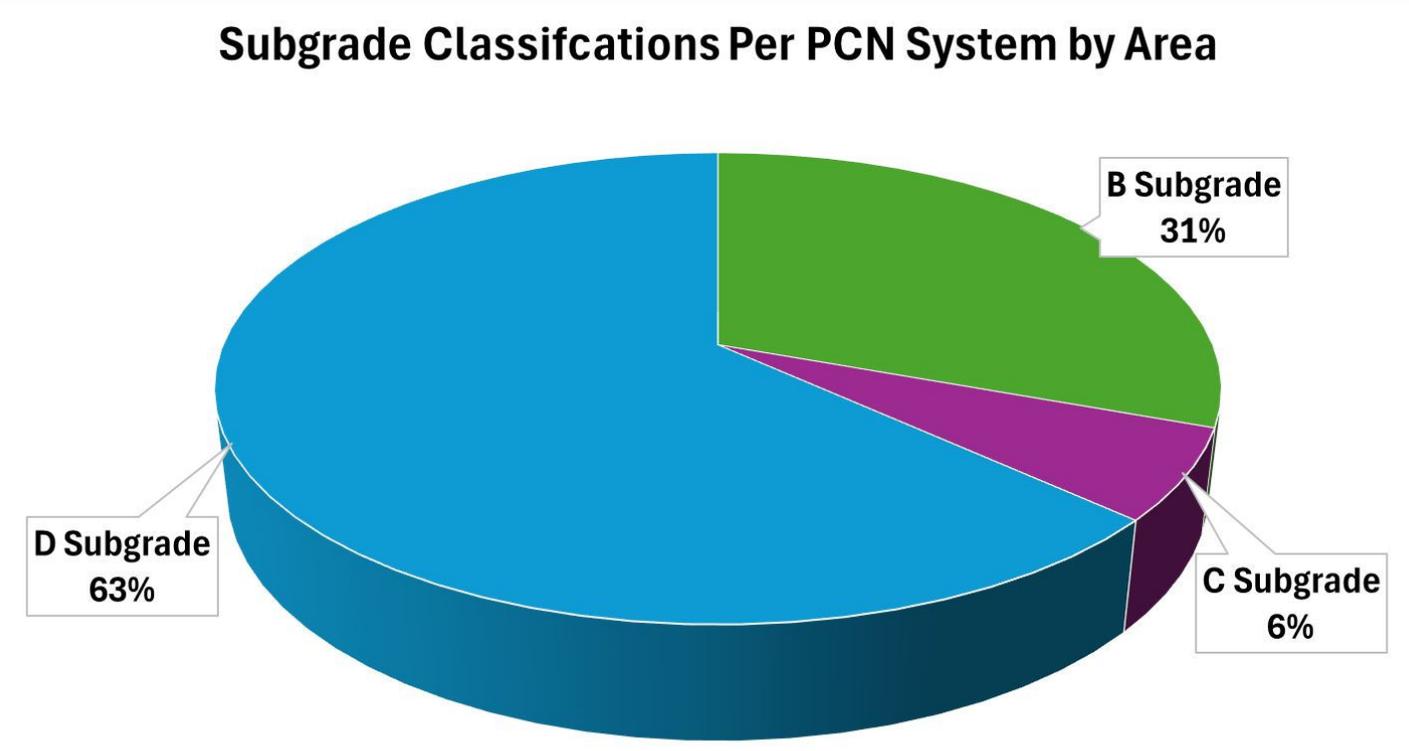

Cold Lake PCR Implementation

- What are the impacts for Cold Lake on the transition from PCNs to PCRs?
 - How much of this impact is attributed to mechanical changes within the strength computations?
- To evaluate changes, a single aircraft traffic mix was applied:
 - 50,000 passes of the CC-177 at 265,352 kilograms
 - PCRs presented are for educational purposes, as published PCRs are based on the anticipated 20-year traffic mix

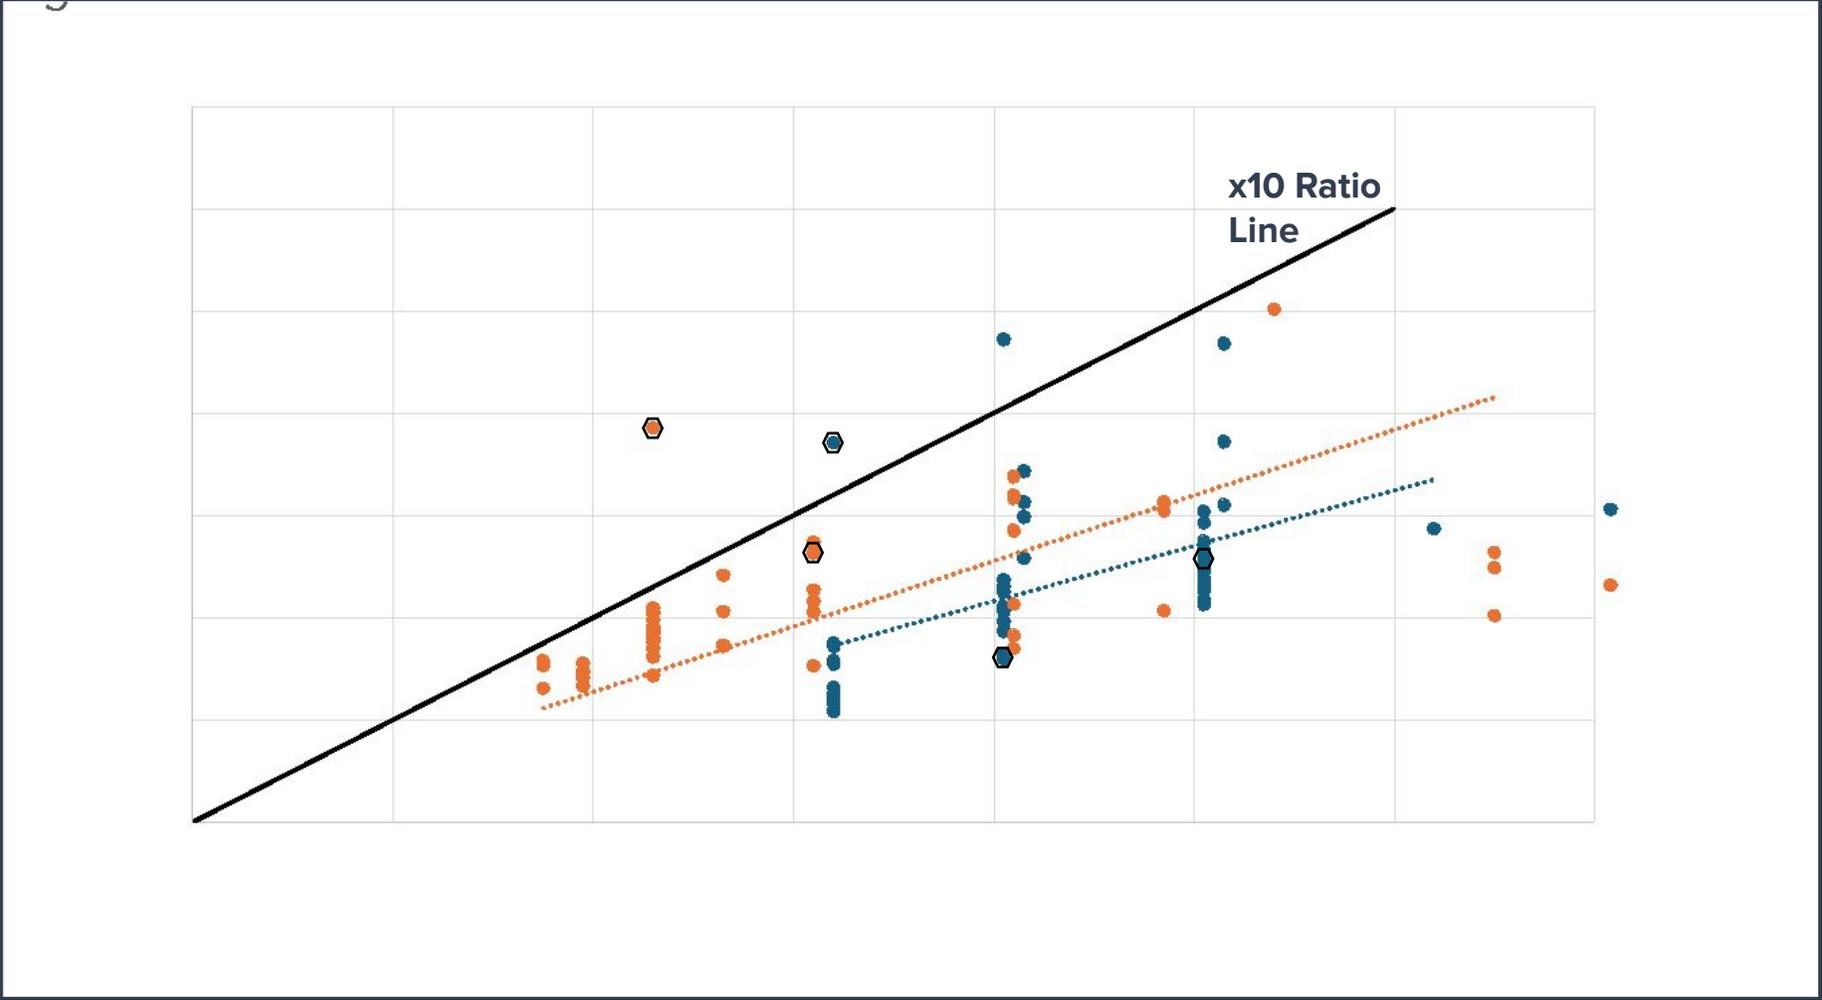

Cold Lake Subgrade Category Changes

- Under PCN system, a mixture of subgrade categories were present
- Under PCR system, only subgrade category D is present
 - All changes are for rigid pavements

Cold Lake PCR vs. PCN Ratio

Cold Lake Example Sections

Section	Pavement Type	Thicknesses, cm			PCR	PCN
		Surface	Base	Subbase		
Apron-01	Concrete	35.1	27.5	17.0	527/R/D/W/T	62/R/B/W/T
Taxiway-01	Concrete	30.6	28.3	-	772/R/D/W/T	46/R/B/W/T
Taxiway-02	Asphalt	23.0	35.3	61.7	330/F/D/X/T	81/F/D/W/T
Taxiway-03	Asphalt	16.2	50.7	53.1	743/F/D/X/T	64/F/D/W/T
Taxiway-04	Asphalt	24.2	54.0	41.9	521/F/D/X/T	101/F/D/W/T

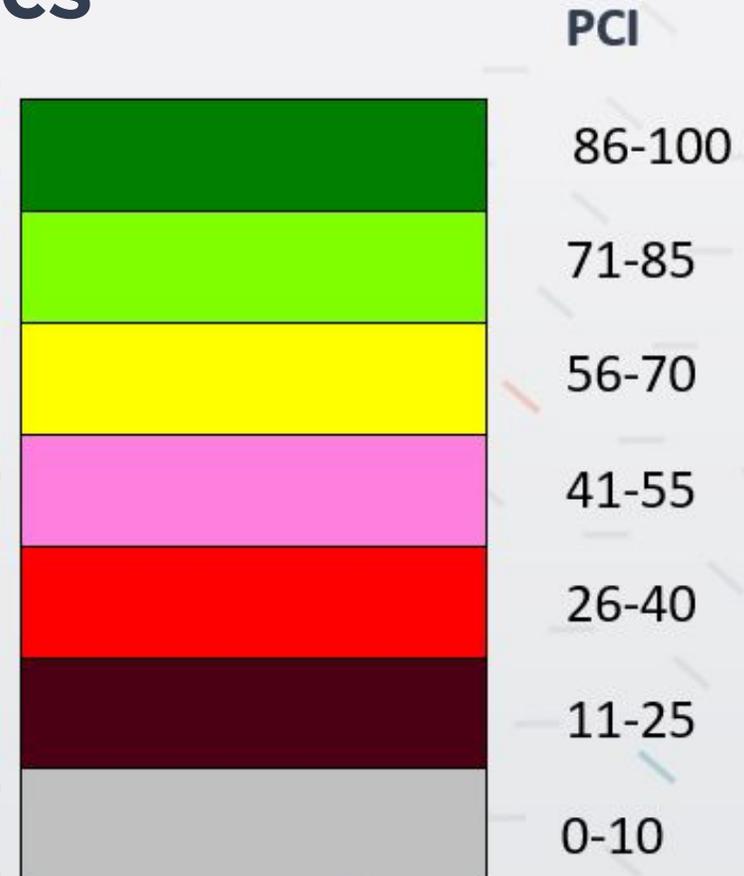

Cold Lake SI Changes

- Three example sections had an SI increase (weaker pavement structure)
- Two example sections had an SI decrease (stronger pavement structure)

Section	Pavement Type	ACR	PCR	ACR/PCR	ACN	PCN	PCR Subgrade	ACN/PCN	SI Delta
Apron-01	Concrete	731.5	527	1.39	65.7	62	B	1.06	+0.33
Taxiway-01	Concrete	731.5	772	0.95	65.7	46	B	1.43	-0.48
Taxiway-02	Asphalt	704.4	330	2.13	70.5	81	D	0.87	+1.26
Taxiway-03	Asphalt	704.4	743	0.95	70.5	64	D	1.10	-0.15
Taxiway-04	Asphalt	704.4	521	1.35	70.5	101	D	0.70	+0.65

Do SI Changes Align with Metrics

- What are the trends in the Pavement Condition Index (PCI)?
 - Are PCI deductions controlled by Load-Related Distresses (LRD)?
- Should the pavement be near (or past) the end of its design life?
- Is this pavement used by a CC-177 significantly?
 - In reality, the traffic mix is more representative of actual traffic

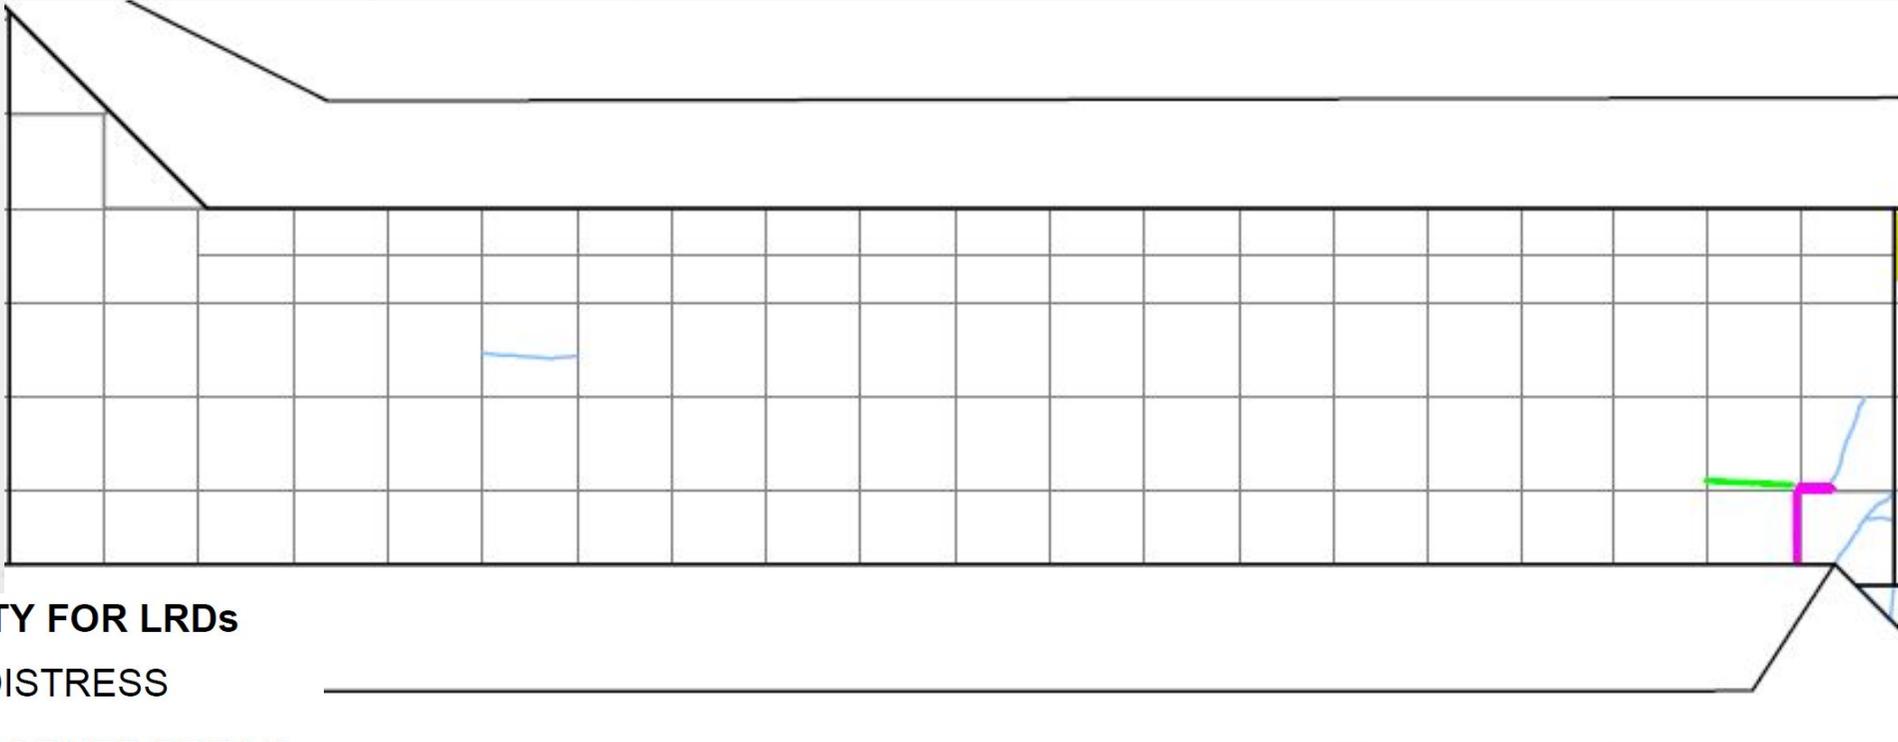

Taxiway-01

- Constructed in 1959
 - Localized maintenance in 2021
- ACN/PCN (CC-177 only) = 1.43
- ACR/PCR (CC-177 only) = 0.95
 - Published ACR/PCR is GOOD
- Frequently used by fighters

Year	PCI	Percent LRDs
2013	80	14
2019	73	14
2024	84	9

Taxiway-01 LRD Distress Map

DISTRESS/SEVERITY FOR LRDs

LOW	MED	HIGH	DISTRESS
			CORNER BREAK
			CRACKING
			SETTLEMENT
			SHATTERED SLAB

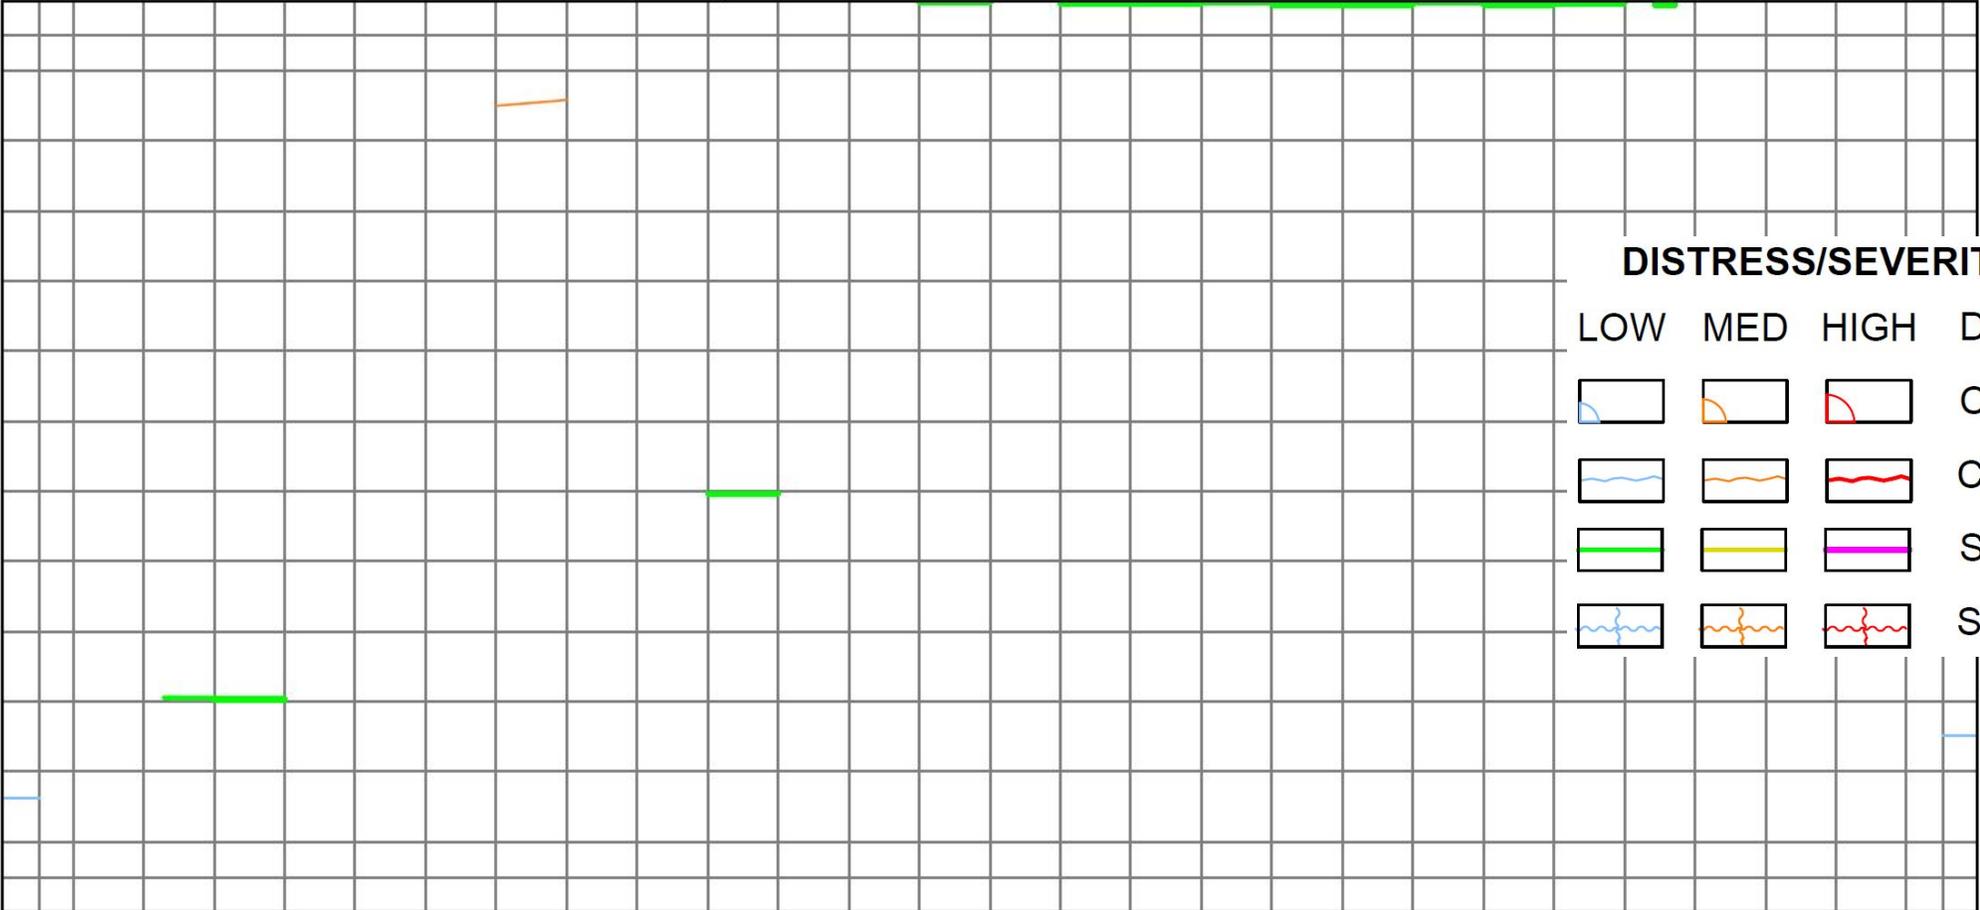

Apron-01

- Constructed in 2002
- ACN/PCN (CC-177 only) = 1.06
- ACR/PCR (CC-177 only) = 1.39
 - Published ACR/PCR is GOOD
- Mostly used by light aircraft

Year	PCI	Percent LRDs
2013	69	0
2019	67	2
2024	67	6

Apron-01 LRD Distress Map

DISTRESS/SEVERITY FOR LRDs			
LOW	MED	HIGH	DISTRESS
			CORNER BREAK
			CRACKING
			SETTLEMENT
			SHATTERED SLAB

Taxiway-02

- Constructed in 1954
 - Three rehabilitations
 - Most recent in 2002
- ACN/PCN (CC-177 only) = 0.87
- ACR/PCR (CC-177 only) = 2.13
 - Published ACR/PCR is FAIR
- Frequently used by fighters

Year	PCI	Percent LRDs
2013	67	35
2019	56	48
2024	50	49

Taxiway-03

- Constructed in 1959
 - Two rehabilitations
 - Most recent in 2005
- ACN/PCN (CC-177 only) = **1.10**
- ACR/PCR (CC-177 only) = **0.95**
 - Published ACR/PCR is **POOR**
- Frequently used by fighters

Year	PCI	Percent LRDs
2013	66	40
2019	58	40
2024	48	46

Taxiway-04

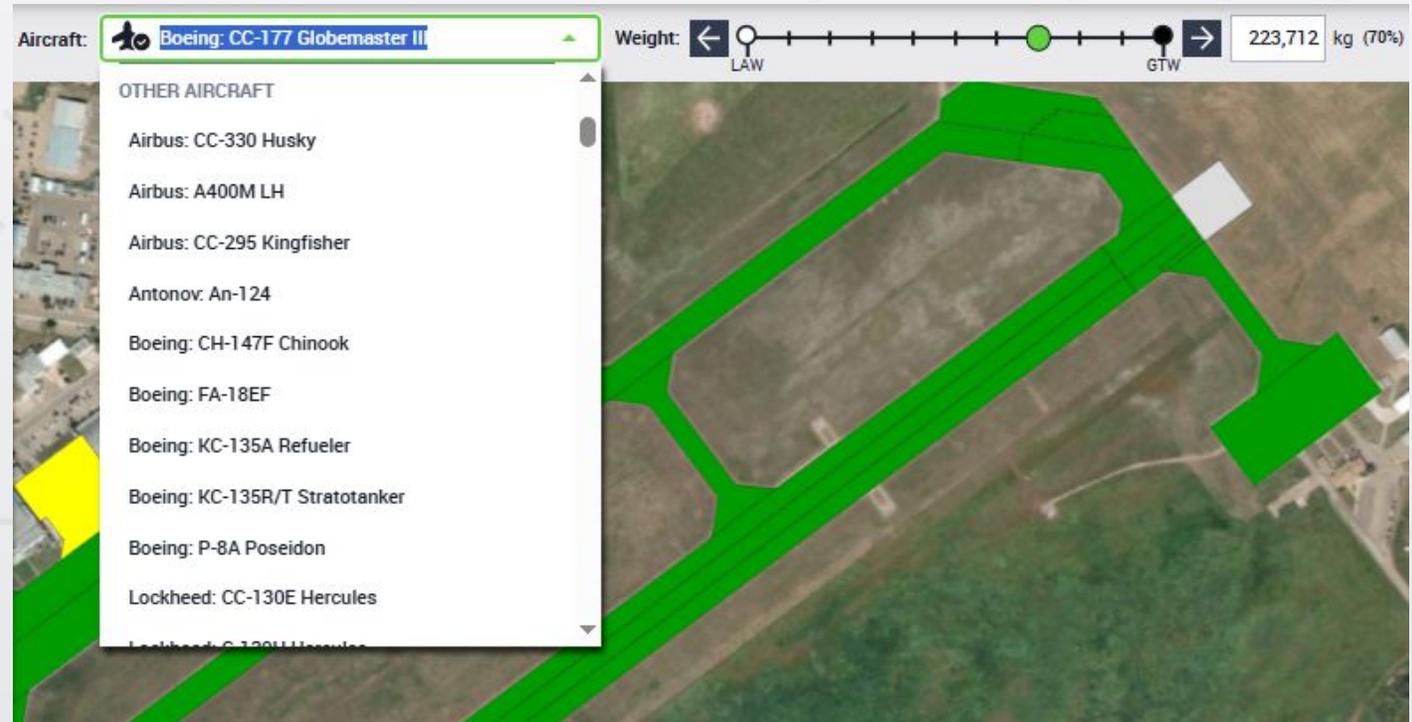

- Constructed in 1954
 - Three rehabilitations
 - Most recent in 2005
- ACN/PCN (CC-177 only) = **0.70**
- ACR/PCR (CC-177 only) = **1.35**
 - Published ACR/PCR is **GOOD**
- Commonly used by fighters

Year	PCI	Percent LRDs
2013	69	0
2019	68	0
2024	64	0

Online Portal PCR Feature

- DAES online portal now contains PCR information for Cold Lake
 - New feature provides easily access to PCR data
 - Feature to be added to other sites
- Customizable aircraft weights allow for theoretical analysis
- Illustrates which aircrafts can use specific facilities without overloading the pavement

Live Demo of Online Portal PCR Feature

The following table summarizes the PCR summary information for pavements at this site. Aircraft ACRs were determined using the latest version of FAA's FAARFIELD pavement design software (i.e., version 2.1.1; Build 12/21/2023) and PCASE. The reported 'Lowest Analyzed Weight' (LTW) for each aircraft is the minimum weight within FAARFIELD or PCASE. Note that CC-330 Husky was not in the 2022 structural pavement evaluation traffic mix, and it is now the most demanding DND aircraft. The most demanding analysed aircraft is the CC-177 Globemaster III.

AIRCRAFT TYPE: Boeing CC-177 Globemaster III WEIGHT: 265,351 kg (Max Gross Taxi Weight)

Branch ID	Section ID	PCR Details	Structural Pavement Type	Pavement Type	Subgrade Strength	ACR Value	PCR Value	ACR/PCR Ratio (Structural Index)	Ratio Comment
